

Well Site Hosting

Oil & Gas is proud to provide a **SCADA** (**S**upervisory **C**ontrol **A**nd **D**ata **A**cquisition) solution that can meet the needs of companies both large and small.

Our Hosting service provides the ability for a producer to view their well and production data 24 hours a day, 7 days a week via our website.

Some of the benefits of our hosting services include:

- 🌐 Polling of your remote RTU's based on a flexible schedule- From every 30 minutes to hourly to anything that is best for you.
- 🌐 The ability to access your production history up to the latest poll, to trend any part of that history, and to export data directly to Excel, all from our website.
- 🌐 Event notification via text message or email. Alarms can be sent based on any number of values, including compressor status, pump status, tank level, flow rate, temperature, etc
- 🌐 Our control memberships give you the option to be able to poll your devices from your Internet Explorer browser.
- 🌐 Knowledgeable support staff only a phone call away.
- 🌐 Support for a wide variety of devices like Kimray, Fisher, Total Flow, as well as the ability to create custom Modbus drivers, in some cases.

Here's how it works:

Oil & Gas communicates to your field devices via Cellular IP radios in a point to point or point to multipoint system. The devices are polled on a schedule. A request for the required information is sent to the field device, which then responds to the SCADA host system. The host system updates the values on the website as the data is received from the field. In the case of values that have alarms associated with them, the system recognizes the alarm state and issues a notification in the method desired, either text message or email.

We have employees in house that have the expertise to take a well from chart recording to SCADA hosting from the ground up.
